### **Analysis of Algorithms**

- Insertion sort
- Asymptotic analysis
- Merge sort
- Recurrences

**Prof. Charles E. Leiserson**

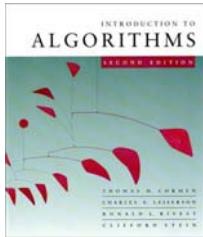

# Analysis of algorithms

*The theoretical study of computer-program performance and resource usage.*

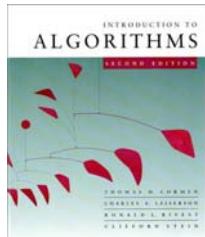

What's more important than performance?

- modularity
- correctness
- maintainability
- functionality
- robustness
- user-friendliness
- programmer time
- simplicity
- extensibility
- reliability

# Why study algorithms and performance?

- Algorithms help us to understand *scalability*.
- Performance often draws the line between what is feasible and what is impossible.
- Algorithmic mathematics provides a *language* for talking about program behavior.
- Performance is the *currency* of computing.
- The lessons of program performance generalize to other computing resources.
- Speed is fun!

# The problem of sorting

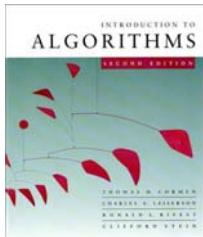

**Input:** sequence  $\langle a_1, a_2, \dots, a_n \rangle$  of numbers.

**Output:** permutation  $\langle a'_1, a'_2, \dots, a'_n \rangle$  such that  $a'_1 \leq a'_2 \leq \dots \leq a'_n$ .

**Example:**

**Input:** 8 2 4 9 3 6

**Output:** 2 3 4 6 8 9

# Insertion sort

“pseudocode”

INSERTION-SORT ( $A, n$ )  $\triangleright A[1 \dots n]$

for  $j \leftarrow 2$  to  $n$

    do  $key \leftarrow A[j]$

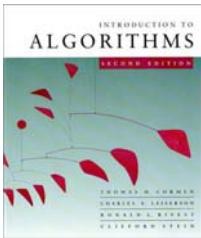

$i \leftarrow j - 1$

        while  $i > 0$  and  $A[i] > key$

            do  $A[i+1] \leftarrow A[i]$

$i \leftarrow i - 1$

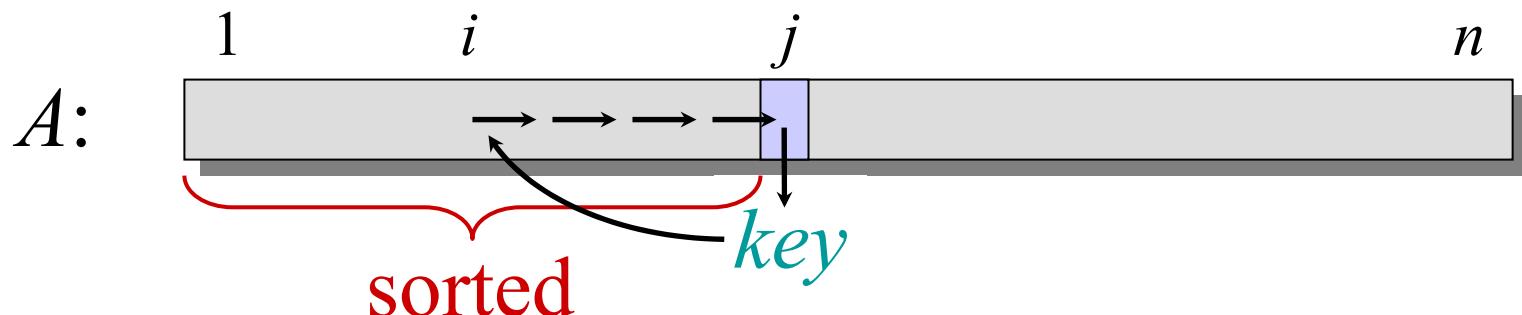

$A[i+1] = key$

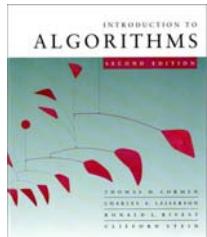

# Insertion sort

“pseudocode”

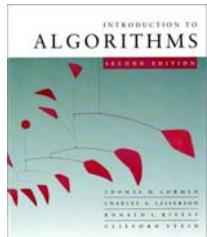

INSERTION-SORT ( $A, n$ )  $\triangleright A[1 \dots n]$   
**for**  $j \leftarrow 2$  **to**  $n$   
    **do**  $key \leftarrow A[j]$   
         $i \leftarrow j - 1$   
        **while**  $i > 0$  and  $A[i] > key$   
            **do**  $A[i+1] \leftarrow A[i]$   
                 $i \leftarrow i - 1$   
         $A[i+1] = key$

# Running time

- The running time depends on the input: an already sorted sequence is easier to sort.
- Parameterize the running time by the size of the input, since short sequences are easier to sort than long ones.
- Generally, we seek upper bounds on the running time, because everybody likes a guarantee.

# Kinds of analyses

## Worst-case: (usually)

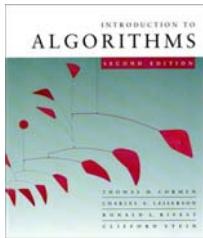

- $T(n)$  = maximum time of algorithm on any input of size  $n$ .

## Average-case: (sometimes)

- $T(n)$  = expected time of algorithm over all inputs of size  $n$ .
- Need assumption of statistical distribution of inputs.

## Best-case: (bogus)

- Cheat with a slow algorithm that works fast on *some* input.

# Machine-independent time

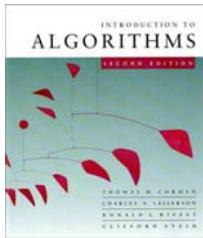

*What is insertion sort's worst-case time?*

- It depends on the speed of our computer:
  - relative speed (on the same machine),
  - absolute speed (on different machines).

## BIG IDEA:

- Ignore machine-dependent constants.
- Look at ***growth*** of  $T(n)$  as  $n \rightarrow \infty$  .

## “Asymptotic Analysis”

# $\Theta$ -notation

## **Math:**

$\Theta(g(n)) = \{ f(n) : \text{there exist positive constants } c_1, c_2, \text{ and } n_0 \text{ such that } 0 \leq c_1 g(n) \leq f(n) \leq c_2 g(n) \text{ for all } n \geq n_0 \}$

## **Engineering:**

- Drop low-order terms; ignore leading constants.
- Example:  $\underline{3n^3 + 90n^2 - 5n + 6046} = \Theta(n^3)$

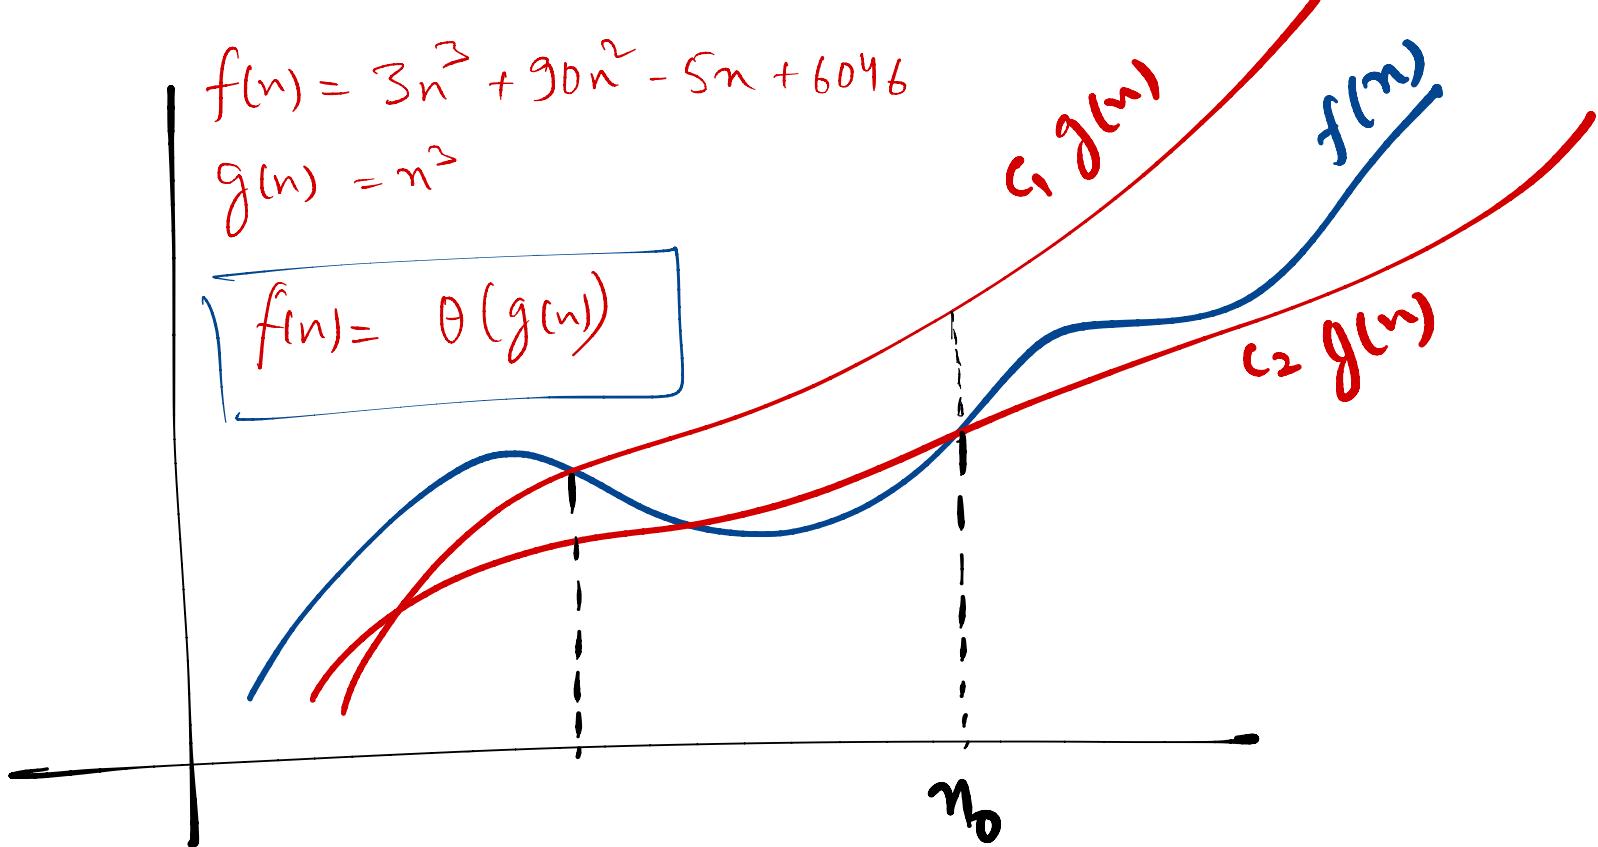

$T(n)$

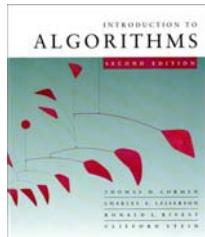

of the order  $n^3$

$$f(n) = 3n^3 + 90n^2 - 5n + 6046$$

$$g(n) = n^3$$

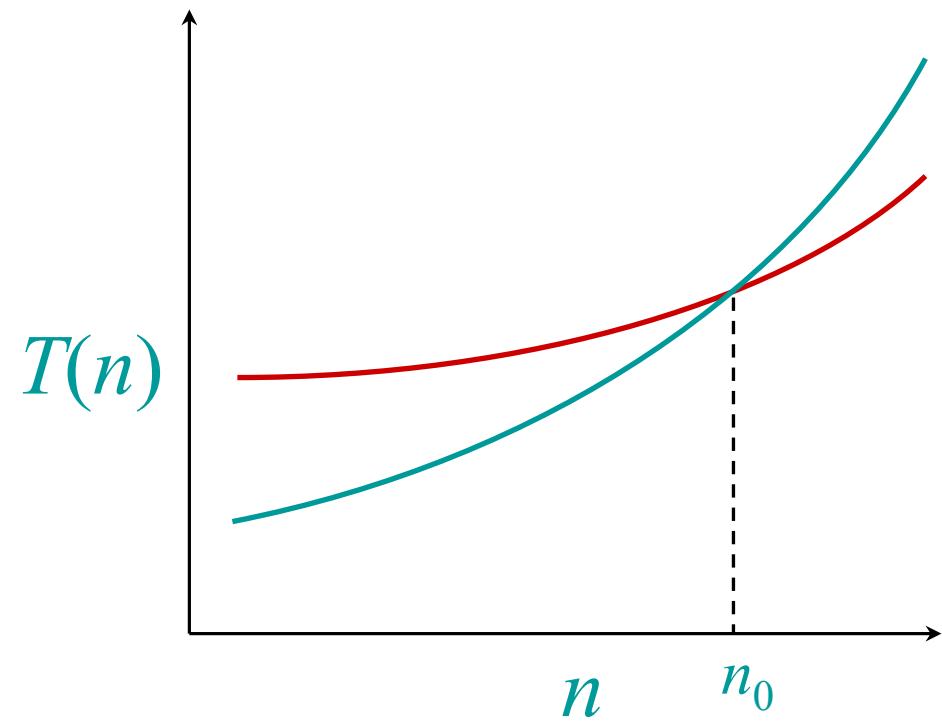

$$f(n) = \Theta(g(n))$$

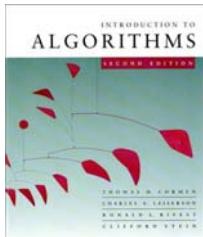

# Asymptotic performance

When  $n$  gets large enough, a  $\Theta(n^2)$  algorithm *always* beats a  $\Theta(n^3)$  algorithm.

- We shouldn't ignore asymptotically slower algorithms, however.
- Real-world design situations often call for a careful balancing of engineering objectives.
- Asymptotic analysis is a useful tool to help to structure our thinking.

# Insertion sort analysis

**Worst case:** Input reverse sorted.

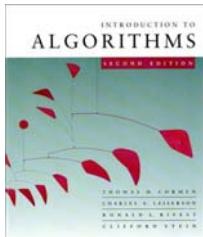

$$T(n) = \sum_{j=2}^n \Theta(j) = \Theta(n^2) \quad [\text{arithmetic series}]$$

**Average case:** All permutations equally likely.

$$T(n) = \sum_{j=2}^n \Theta(j/2) = \Theta(n^2)$$

*Is insertion sort a fast sorting algorithm?*

- Moderately so, for small  $n$ .
- Not at all, for large  $n$ .

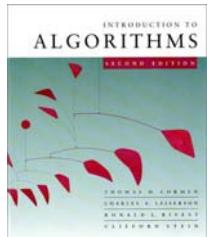

# Merge sort

**MERGE-SORT**  $A[1 \dots n]$

1. If  $n = 1$ , done.
2. Recursively sort  $A[1 \dots \lceil n/2 \rceil]$  and  $A[\lceil n/2 \rceil + 1 \dots n]$ .
3. **“Merge”** the 2 sorted lists.

***Key subroutine: MERGE***

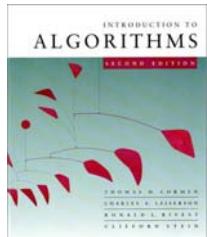

# Merging two sorted arrays

# Merging two sorted arrays

# Merging two sorted arrays

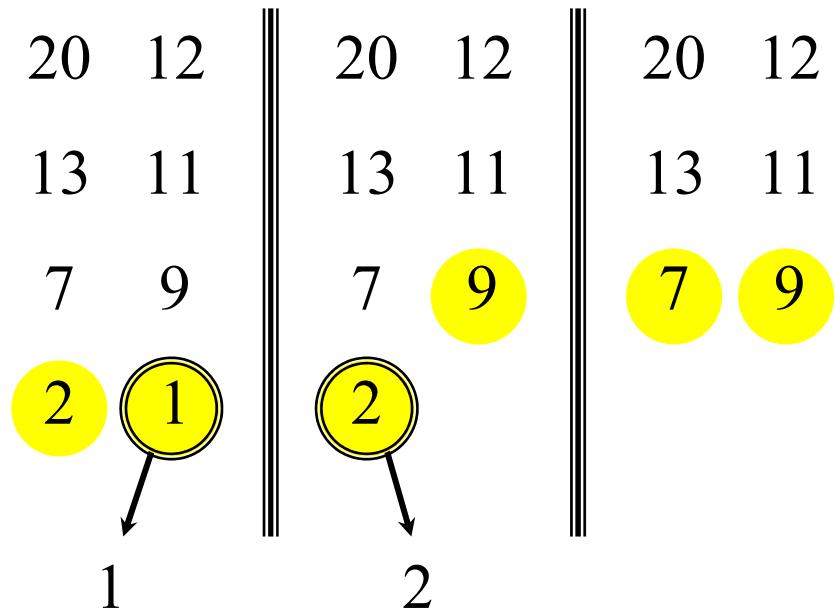

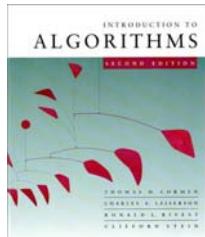

# Merging two sorted arrays

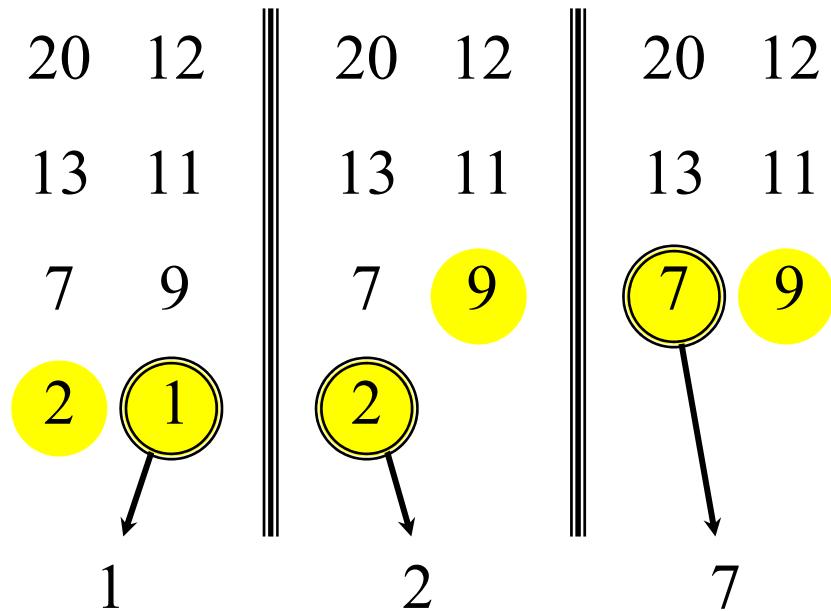

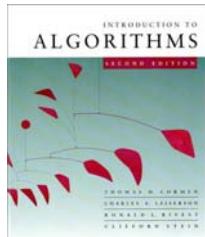

# Merging two sorted arrays

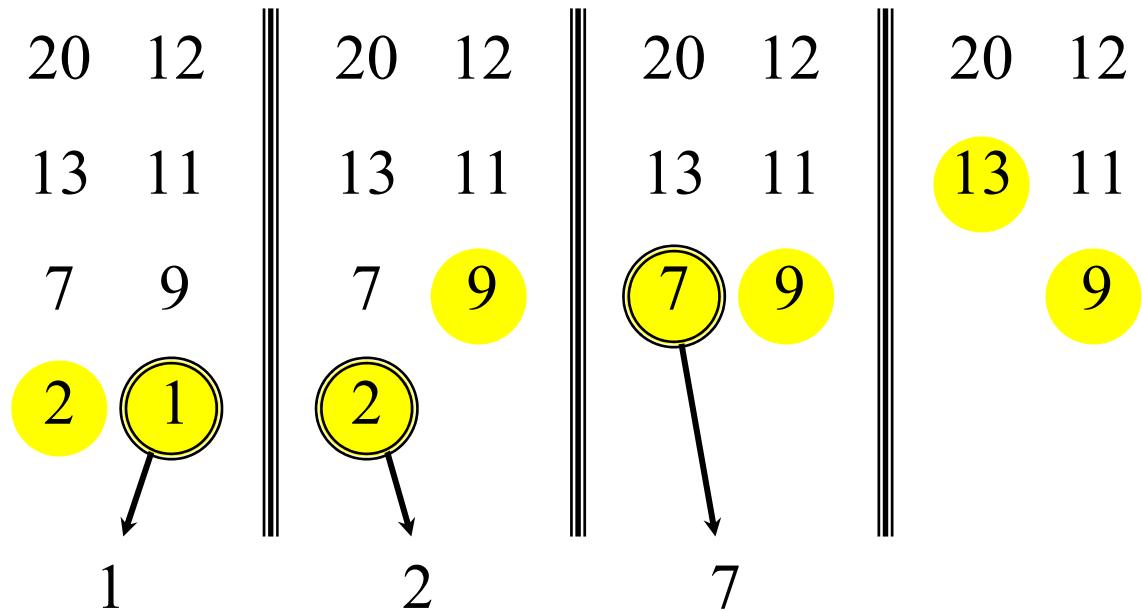

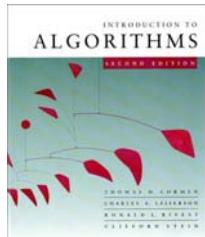

# Merging two sorted arrays

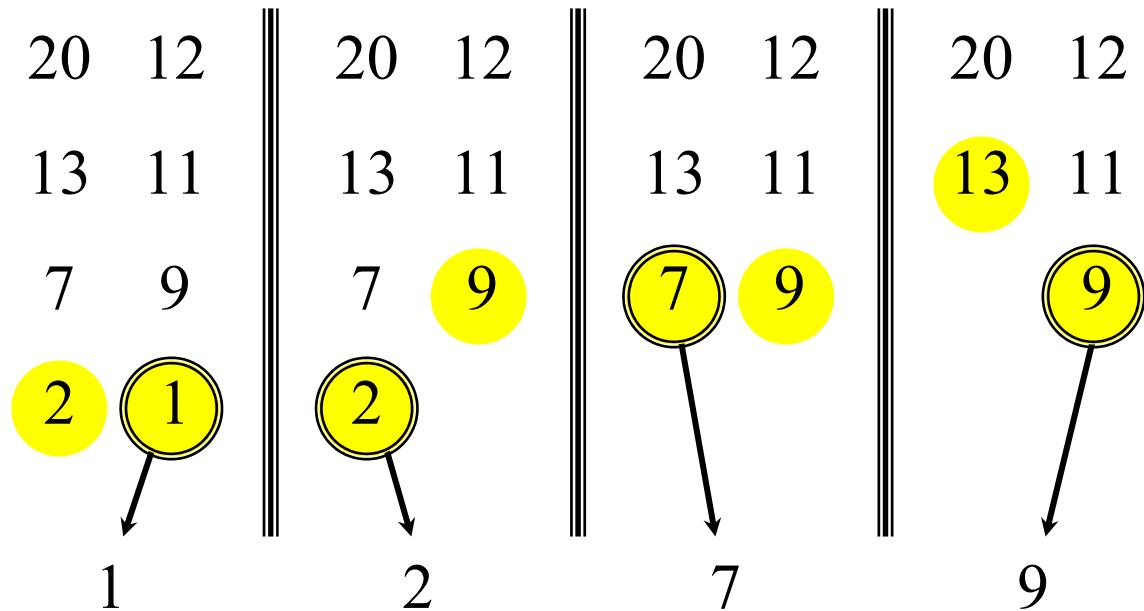

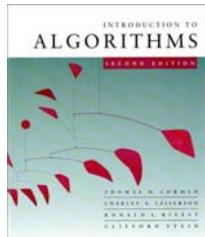

# Merging two sorted arrays

Time =  $\Theta(n)$  to merge a total of  $n$  elements (linear time).

# Analyzing merge sort

$T(n)$	<b>MERGE-SORT <math>A[1 \dots n]</math></b>
$\Theta(1)$	1. If $n = 1$ , done.
$2T(n/2)$	2. Recursively sort $A[1 \dots \lceil n/2 \rceil]$ and $A[\lceil n/2 \rceil + 1 \dots n]$ .
$\Theta(n)$	3. <b>“Merge”</b> the 2 sorted lists

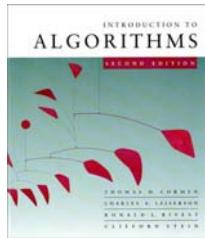

**Sloppiness:** Should be  $T(\lceil n/2 \rceil) + T(\lfloor n/2 \rfloor)$ , but it turns out not to matter asymptotically.

# Recurrence for merge sort

$$T(n) = \begin{cases} \Theta(1) & \text{if } n = 1; \\ 2T(n/2) + \Theta(n) & \text{if } n > 1. \end{cases}$$

- We shall usually omit stating the base case when  $T(n) = \Theta(1)$  for sufficiently small  $n$ , but only when it has no effect on the asymptotic solution to the recurrence.
- CLRS and Lecture 2 provide several ways to find a good upper bound on  $T(n)$ .

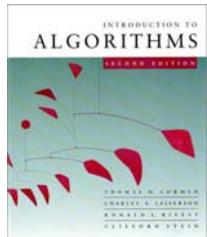

# Recursion tree

$$T(n) = 2T(n/2) + \Theta(n)$$

Solve  $T(n) = 2T(n/2) + \underline{cn}$ , where  $c > 0$  is constant.

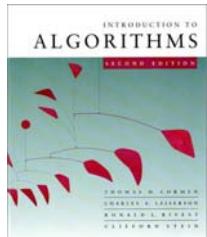

Recursion

# Recursion tree

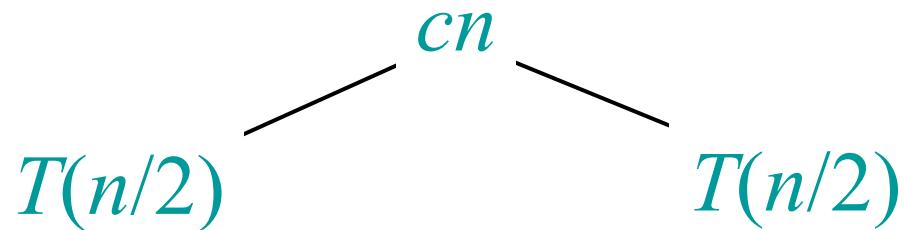

Solve  $T(n) = 2T(n/2) + cn$ , where  $c > 0$  is constant.

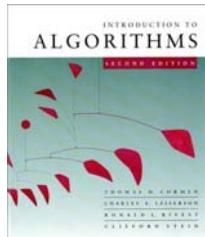

$T(n)$

# Recursion tree

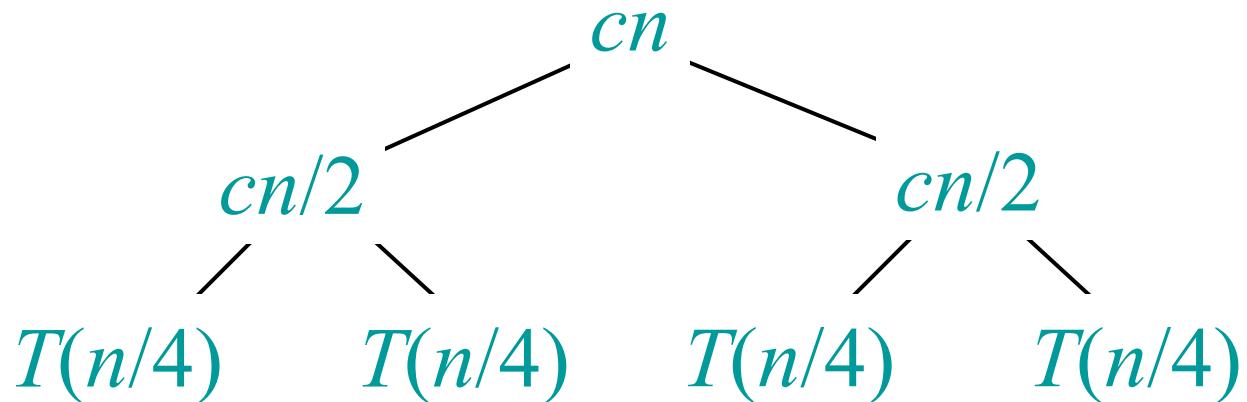

Solve  $T(n) = 2T(n/2) + cn$ , where  $c > 0$  is constant.

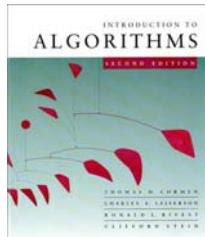

# Recursion tree

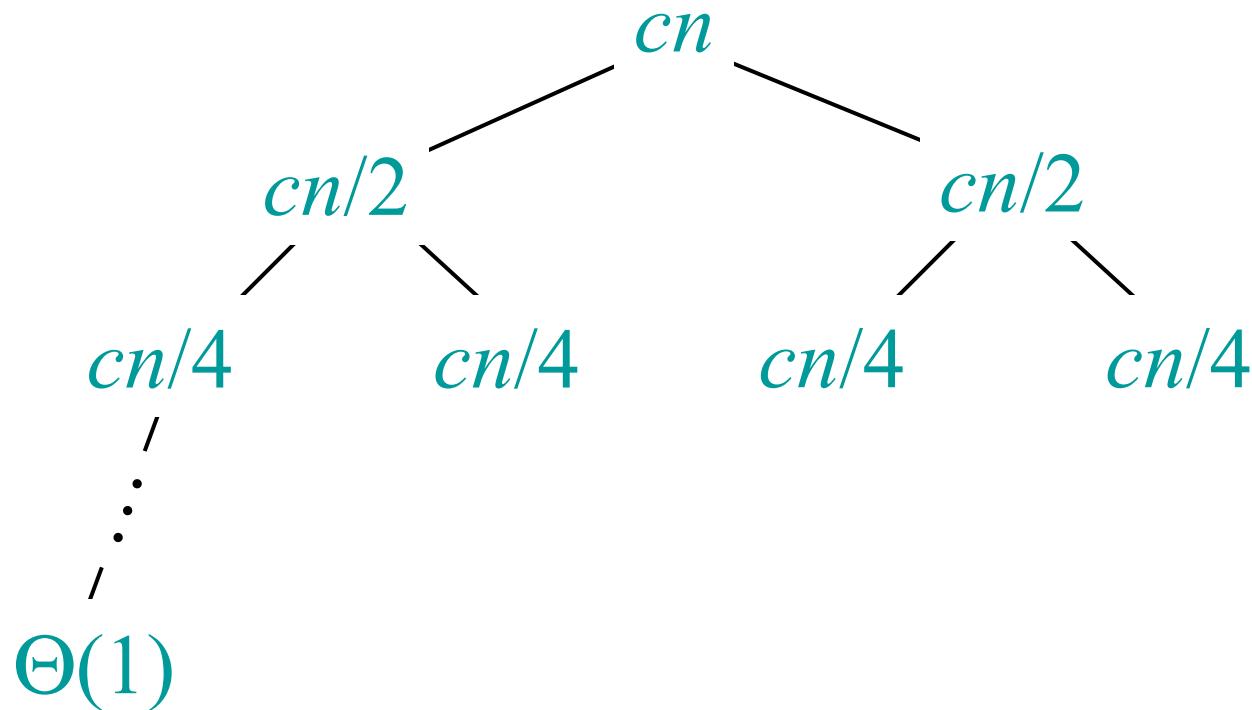

Solve  $T(n) = 2T(n/2) + cn$ , where  $c > 0$  is constant.

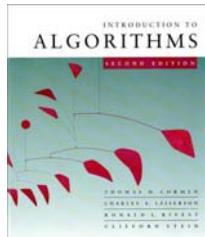

# Recursion tree

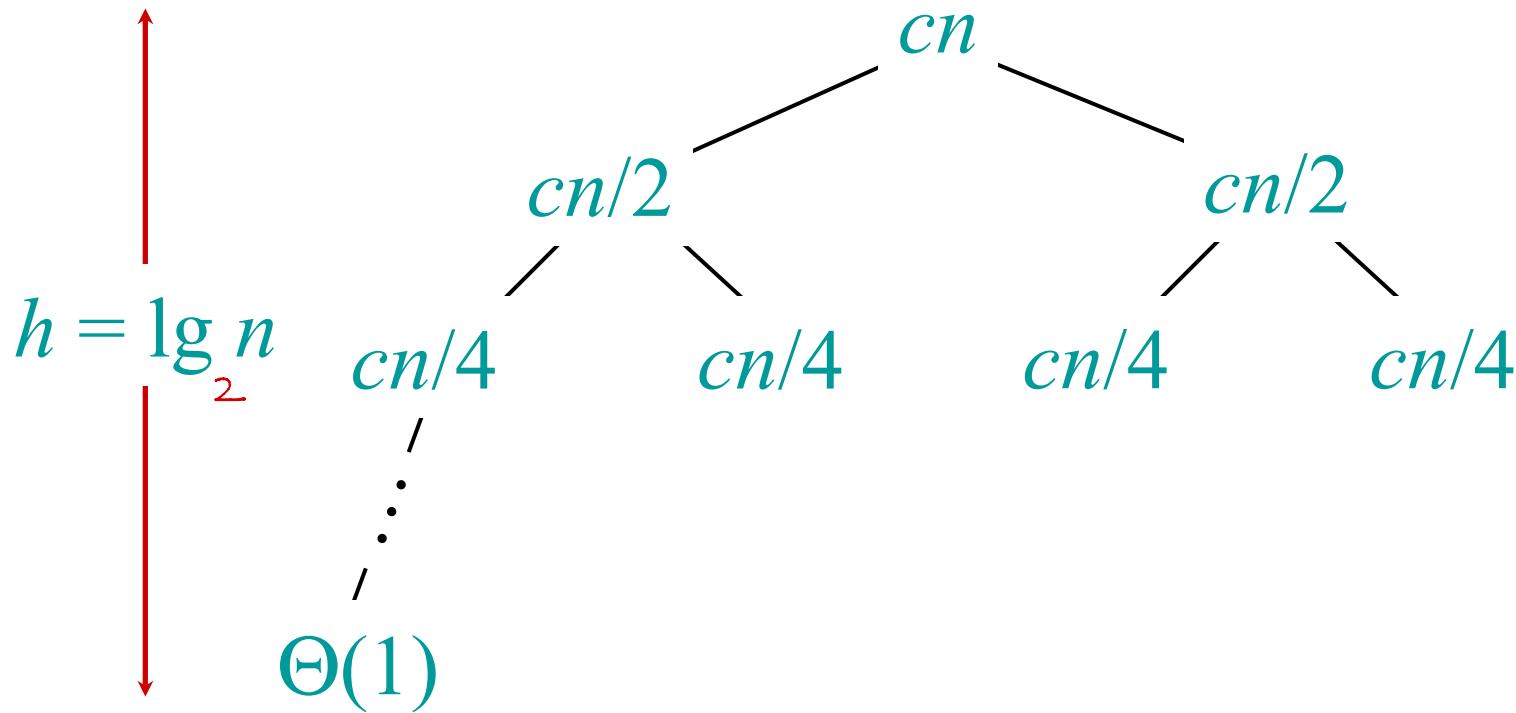

Solve  $T(n) = 2T(n/2) + cn$ , where  $c > 0$  is constant.

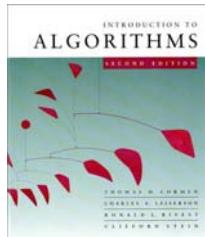

# Recursion tree

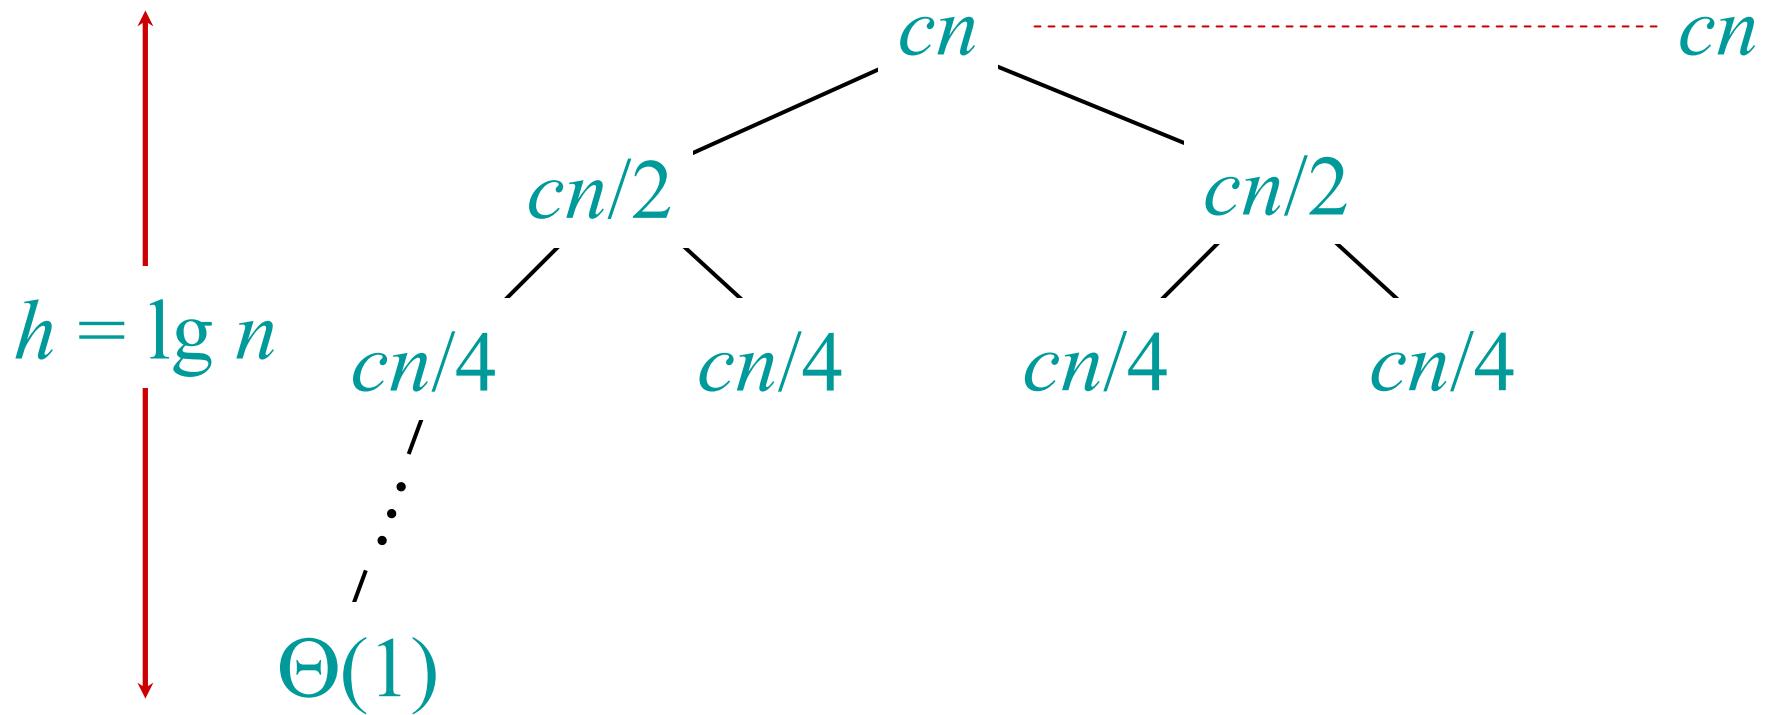

Solve  $T(n) = 2T(n/2) + cn$ , where  $c > 0$  is constant.

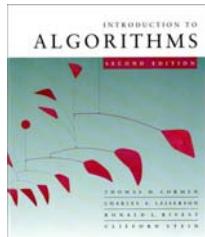

# Recursion tree

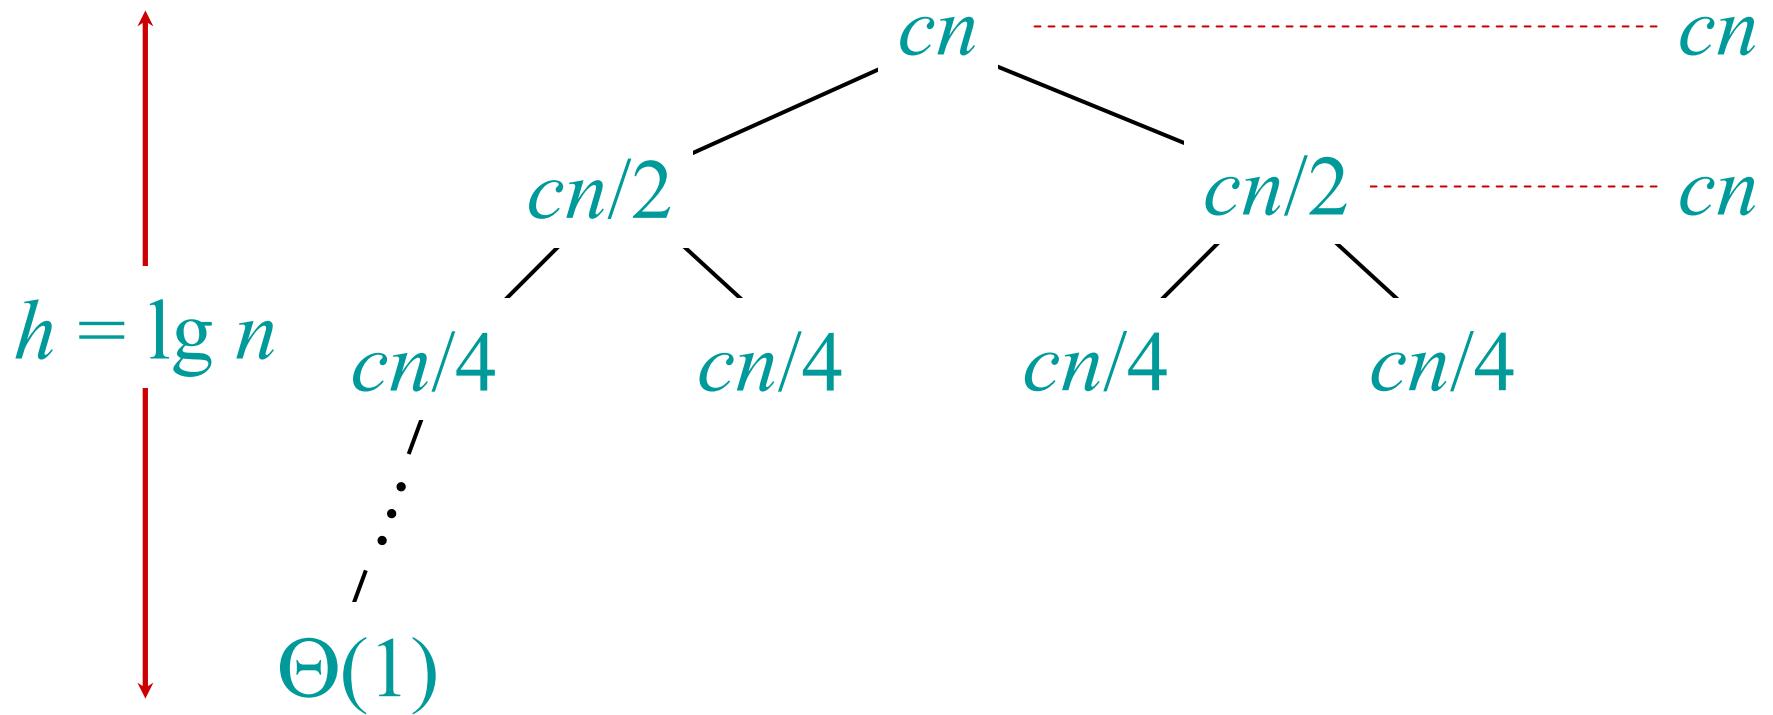

Solve  $T(n) = 2T(n/2) + cn$ , where  $c > 0$  is constant.

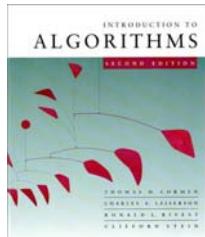

# Recursion tree

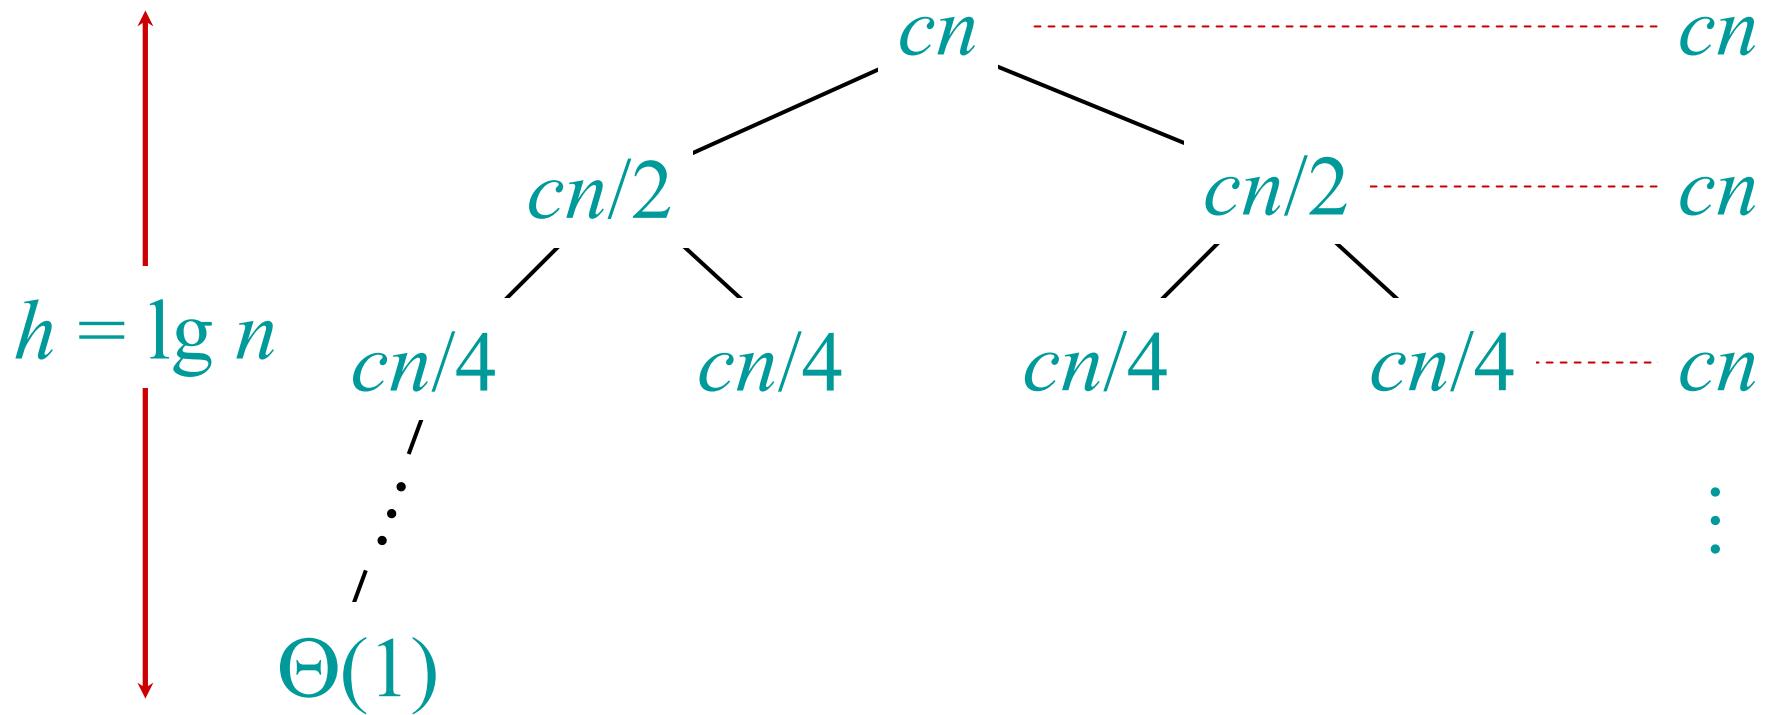

Solve  $T(n) = 2T(n/2) + cn$ , where  $c > 0$  is constant.

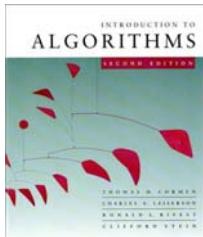

# Recursion tree

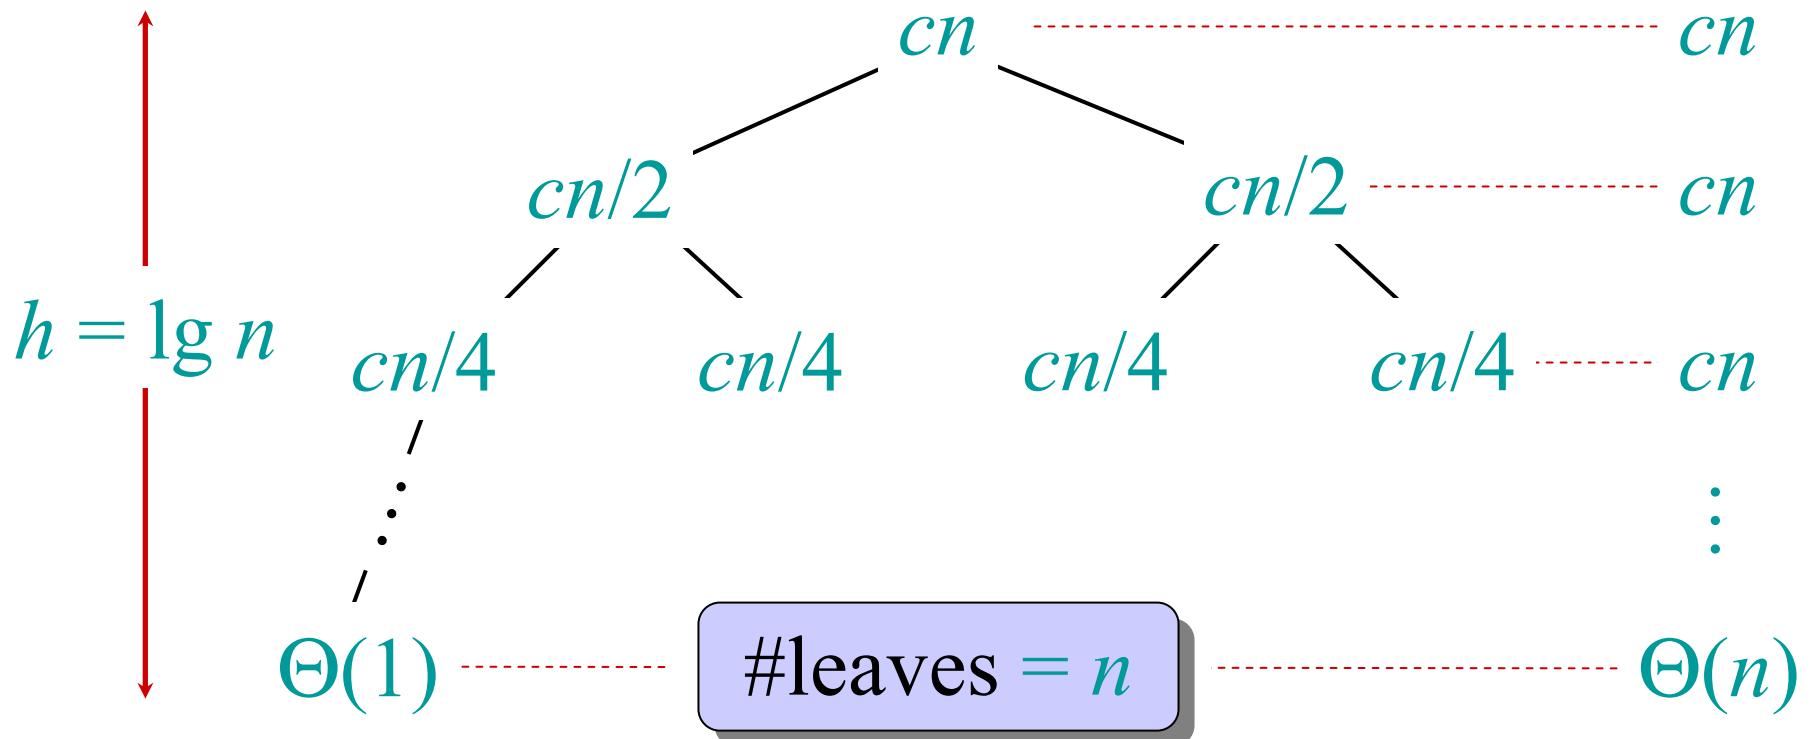

Solve  $T(n) = 2T(n/2) + cn$ , where  $c > 0$  is constant.

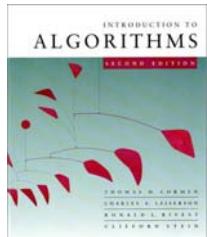

# Recursion tree

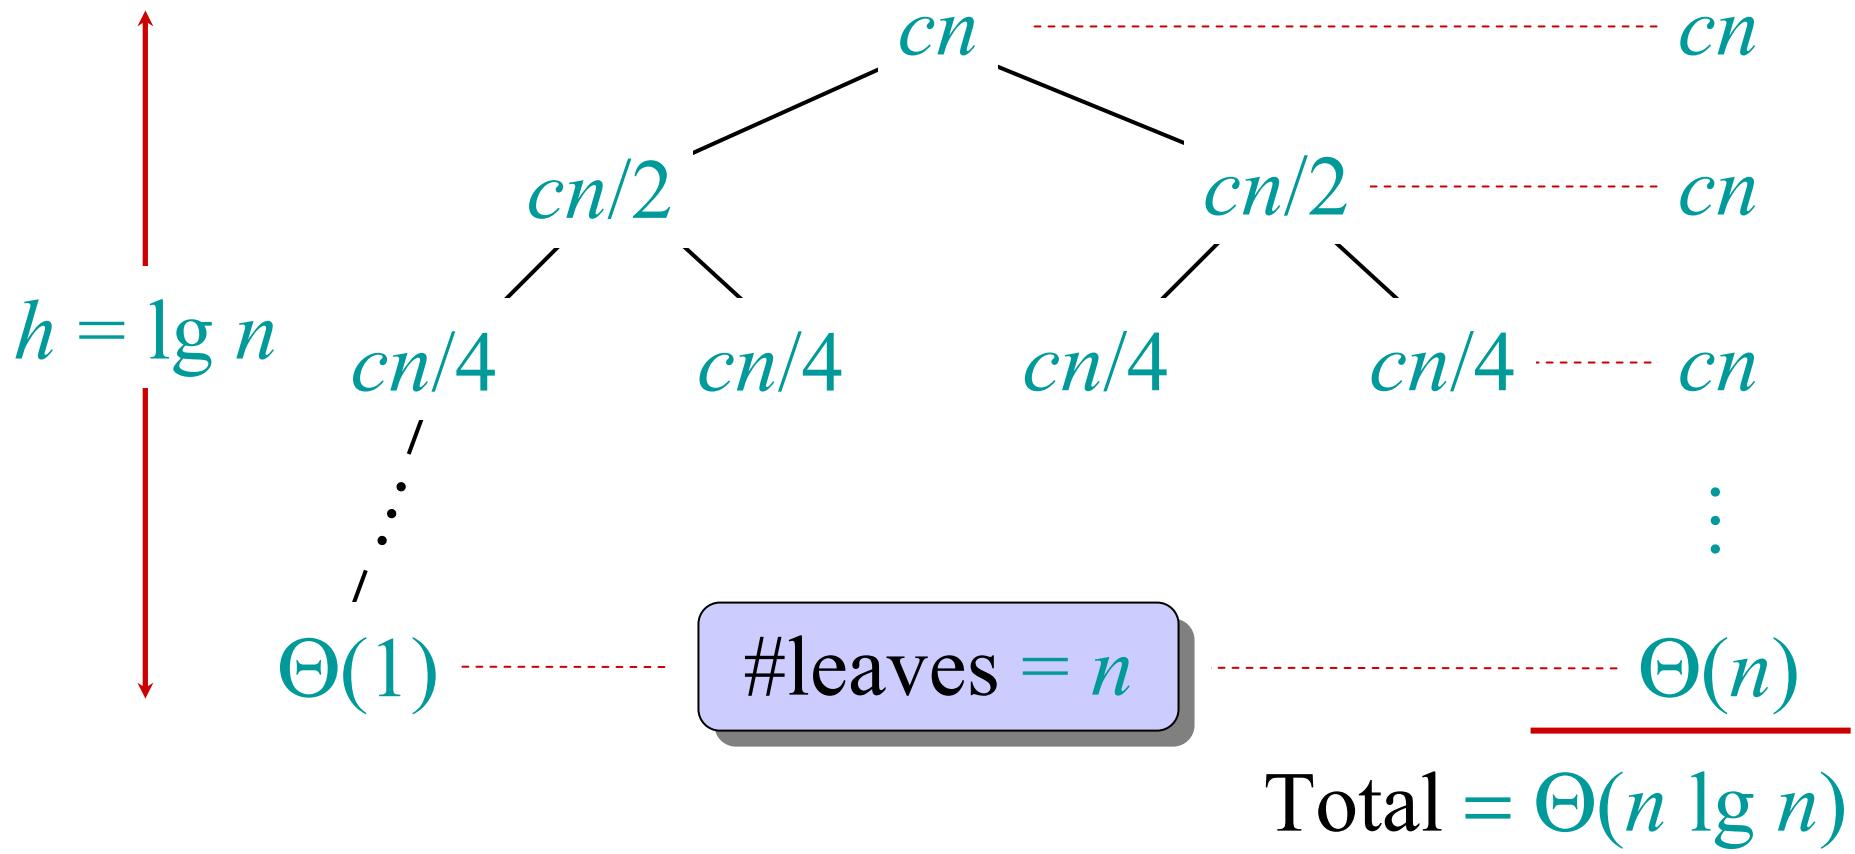

Solve  $T(n) = 2T(n/2) + cn$ , where  $c > 0$  is constant.

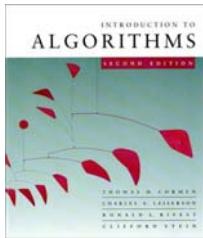

# Recursion tree

Solve  $T(n) = 2T(n/2) + cn$ , where  $c > 0$  is constant.

# Conclusions

- $\Theta(n \lg n)$  grows more slowly than  $\Theta(n^2)$ .
- Therefore, merge sort asymptotically beats insertion sort in the worst case.
- In practice, merge sort beats insertion sort for  $n > 30$  or so.
- Go test it out for yourself!
