Array

An array is a collection of elements of the same data type stored in contiguous memory locations. It allows accessing elements using an index (starts with 0).

Arrays are commonly used to store and manipulate a group of related values (Homogeneous value).

Exercise

Write a C program to store n (< 100) integers in an array and rotate the elements to the left by one position. Moreover, print the elements of the array.

Instructions:

1. **Part 1:** Write the logic (set of steps) to solve the above problem.
2. **Part 2:** Write a C program based on the logic given in Part 1.

HINT: You can declare array with size 100

Sample Input:

Enter number of elements: 6

Enter 6 integers:

5
10
15
20
25
30

Sample Output:

Array before rotation:

5 10 15 20 25 30

Array after rotation:

10 15 20 25 30 5
